

PHP ASSIGNMENTS FOR BEGINNERS

PHP Assignments for Beginners

You are a web developer at a software company .Your responsibility is to build a dynamic user registration system at your software company for the upcoming launch of a new website.

Users should be able to establish an account through the registration system by entering essential details including name and email and password along with active email verification and effective password quality assessment.

The system requires protected user login access and it provides an email-based method to reset lost passwords.

The system needs you to create both the design and implementation of the following elements:

- The system provides users with a form to submit their personal details.
- The system contains a validation script that checks for correct email formatting alongside strong password creation and verifies each entered email does not exist elsewhere.
- Users can obtain access by logging into a system secured through their registered credentials.
- An email-based password reset mechanism.
- Appropriate error handling and user feedback throughout the process.

Deliverables:

The PHP codebase includes registration and login functions along with related security options and validation checks.

The document describes (200-300 words) your system design methods while concentrating on security features alongside validation protocols and user interface design.

The system should function securely by maintaining proper user data handling protocols.
